Quanum™

Enterprise Content Solutions
Deep Search

The Quanum Enterprise Content Solutions Deep Search module provides a configurable search utility to unlock your structured and unstructured content from the documents, files, and images generated across your organization. Integrate data silos to access your information, accelerate insight discovery, and increase effectiveness of finding the right information at the right time.

The core capabilities of Deep Search include:

Data Enrichment
- Get enriched data with relevant indicators to enhance search results
- Enhance search functionality with multiple data formats
- Obtain native view of files based on search criteria

Advanced Enterprise Search
- Perform conceptual search unconstrained by keywords
- Integrate data silos to empower robust searching
- Enjoy personalization and knowledge management

Knowledge Discovery
- Accelerate insight discovery to uncover trends, patterns, and relationships
- Eliminate detailed report requests and hand off risks
- Get holistic intelligence and reduce blind spots

Structured data

Text recognition

Image search

Unstructured data

Find the right information at the right time

Challenge	Solution
Preparing patient records for **litigation** can be a challenging and time-consuming process. It is critical to catch every document that includes a specific term.	Deep Search enables a quick and seamless e-discovery process to search for and locate all the critical information necessary for litigation and legal inquiries.
If **legacy systems** are not kept current from a release and support perspective, this can ultimately present a risk to your organization.	With your legacy content in Enterprise Content Solutions, Deep Search provides access to these critical records with ease, without the need to maintain old, unsupported systems.
19.8% of time spent doing business—the equivalent of 1 day per working week—is **wasted by employees searching** for information to do their job effectively.*	Deep Search enables contextual keyword searching so users find the right information quickly and easily.
Ineffective search tools cause a **decline in productivity**, employee morale, and ultimately patient satisfaction.	Deep Search drives productivity and process efficiency by delivering the right information to the right users at the right time.

The business process-improvement possibilities are endless.
